### BROONS OFFERS EXPANDED SERVICE FOR RE-MANUFACTURED GRID ROLLERS

International crushing and compaction specialists Broons have been manufacturing and re-manufacturing Towed Grid Rollers for Australia's country roads for over 20 years.

Grid Rollers are considered to be an important plant item in council fleets and hundreds of these machines are in constant use around the Nation building and maintaining gravel roads. Many of them have been re-manufactured or delivered new by Broons.

Broons is now offering a change-over service where the customer sends in their old worn Hyster Grid Roller rings and Broons change them over with complete new castings they hold in stock. Consequently, turn-around time is minimised, while the same high quality Broons product is still assured.

At the same time Broons is still offering its re-knuckling service, where they re-knuckle worn grid rings in machines that some Councils have had in their fleet for over 30 years. And, Broons can also undertake other work on the roller, so that a tired Grid Roller virtually becomes a new machine again.

Or, a customer can order a new Broons Grid Roller. They're a highly efficient robust machine designed and built to withstand the extreme conditions in which they frequently operate. Experience shows they simply don't break down.

Broons have two mainstream models in their range – the BH-14 (fixed drawbar) and BH-14H (hydraulically adjustable offset drawbar) – and both are designed to crush and compact rocks in a flat pad or windrow to produce base course rubble.

All of Broons equipment has a reputation for quality and the Towed Grid Rollers are both simple to use and extremely easy to maintain. A phone call today to (08) 8268 1988 will quickly show you how a Broons Towed Grid Roller can help you with your crushing and compaction problems.
