

COMPACT CRUSHER LAUNCHED ONTO THE AUSSIE MARKET

Adelaide based crushing and compaction specialists, Broons Hire announce their appointment as Australian Distributors for the popular Kirpy WX-300 Rock Crusher.

Broons' Manager Market Development, Stuart Bowes says, "The Kirpy WX-300 crusher is built with quality and serviceability in mind unlike alternatives on the market. For some time we have been looking for a machine that will complement our widely successful BH-1220 Rockbuster that can perhaps handle the rougher ground without sacrificing the quality of end product and we believe the WX-300 is the answer."

"Too many machines these days are designed with features that prohibit cost effective maintenance and replacement of wear parts. They have all the trimmings but lack the basic philosophy of function and simplicity. The Kirpy WX-300 follows the practical design features of our Rockbuster," said Mr Bowes.

"The WX-300 is widely suited to road making in the forest industry and telecommunications cable laying operations where oversize needs to be quickly reduced before back filling of the trench. Vineyards and Orchardists will find significant benefits using the WX-300 to crush unsightly oversize left lying around after development".

The Kirpy WX-300 is purpose built to cater for the rigours of crushing hard rock. With a travel speed of around 300m to 800m per hour, the WX-300 can process up to 1100m³ per hour. It can handle infeed up to 500mm minus with a crushing capability down to 60mm minus.

Replacement wear hammer blocks come in two options; standard steel with hard facing and carbide tip for extremely hard materials. Replacement can be carried out on site in under 60 minutes.

A hydraulically adjustable breaker anvil fitted with a hydro-pneumatic safety device and rear flap ensure complete safety during operation. A chain curtain is fitted to the front to prevent the egress of flyrock.

Weighing in at around 5.4 tonnes, the compact crusher can be mounted to the 3 point linkage on any standard agricultural tractor with around 250 PTO horsepower.

An added advantage of the WX-300 is it's ability to process raw excavation or quarry products to a depth of 450mm if required.

Although new to the Australian market, Broons are sure the WX-300 will have many satisfied owners "Down Under" in years to come.
